SAMSUNG

Ubigate™ – High performance, multi-service business gateway

What is Ubigate?

With full routing capabilities, enterprise-class switching capacity, VoIP and best-in-class integrated security, the Samsung Ubigate™ iBG Series Convergence Platform replaces a multitude of special-purpose network devices and delivers an agile and efficient network infrastructure. The Ubigate™ iBG Series enables true enterprise voice and data convergence through a wide range of QoS features and support for both analog/digital and IP phones. And by extending IP telephony services securely across WANs, the Ubigate™ iBG Series can take your business communications to new levels of efficiency and productivity.

Who is a typical customer of Ubigate?

The 4 systems currently in the Ubigate™ iBG Series range allow it to span right across the user spectrum, from 1 right up to 500+ users. Being a high performance multi-service gateway means the series has broad appeal across all vertical spectrums. Cross platform standards and a non proprietary architecture make the Ubigate™ iBG Series simple to install and interoperable with any existing end user equipment.

Why do end users need this type of product?

While the network has become an ever more essential part of the enterprise, the complexity of managing that network has grown exponentially. The bottom line is that management costs now add up to a significant part of the total cost of ownership for enterprise networking technology. The Ubigate™ iBG Series offers businesses the right choice for unified networking, by bringing Data / Voice / Security and Switching into a single platform.

So what will a business gain by deploying Samsung Ubigate products?

Deploying a single device to do the job of 4 or more current devices will ultimately simplify network infrastructure and drive down the total cost of ownership. One device to power, one device to manage and maintain.

Featuring an architecture with performance to spare, modular design, and support for advanced features like IPv6, Metro Ethernet, and MPLS, the Ubigate™ iBG Series protects your investment from obsolescence and the need for short-term upgrades.

Can it integrate into my customer existing network?

Yes, the Ubigate™ iBG Series is designed to interoperate with other vendors equipment, allowing customers to gradually move across to a fully converged environment at a pace they are comfortable with. A key highlight of the Ubigate™ iBG Series is its ability to enable legacy voice equipment, offering the customer the capability to take advantage of VoIP, without the replacement of costly legacy PBX hardware.
